

How The Carousel Gets Its Data

1. View Layer (Views/Home/Index.cshtml)
 - Displays the carousel using a List<Game> model.
 - Uses foreach(var game in Model) to create <div class="carousel-item"> elements with game.Thumbnail and game.Title.
 - Clicking a game directs the user to GameController.Play(int id).
2. Controller Layer (Controllers/HomeController.cs)
 - Index() action calls _httpClient.GetGamesList() to get the list of games.
 - Passes that list to the Index view as the Model.
3. Service Layer (MicroServices/MicroClient.cs)
 - Acts as the gateway between the MVC app and backend microservices.
 - GetGamesList() returns a cached list of Game objects.
 - Internally, it calls GetGamesWithInfo() → GetGamesAsync().
4. HTTP Request (GetGamesAsync())
 - Sends an HTTP GET to /Gateway.
 - Receives JSON of GameInfo[].
 - Deserializes into GameInfo objects.
 - Filters out disabled games (GameFeatureManager.IsEnabled).
 - Converts GameInfo → Game objects for the MVC app.
